LightSheer® Hair Reduction
The look and feel you desire

Why LightSheer® Laser Hair Reduction?

Maximal treatment comfort

Optimal results

Short treatment time

What should I expect?

When will I see results?

Multiple treatments are required to achieve permanent hair reduction. This is due to the increased effect of the laser on hair in the early growth stage (anagen). Not all the hairs are in the same phase at a given time.

What can I expect after treatment?

The appearance of the treated area following treatment varies from patient to patient, depending on the characteristics of the patient and treatment given.

During the treatment, some hairs will shed from the follicle immediately, while the remaining will shed in the following weeks. Transient redness and swelling around the hair follicle may appear immediately after the treatment, but are in fact, positive results indicating the follicle's response to the treatment.

Following the treatment, you will be provided with guidelines, namely in terms of sun exposure.

What is it?

About hair removal

In the past, methods for hair removal included plucking, shaving, waxing, electrolysis and chemical depilatories. Some are painful, some are messy, all of them are time consuming and are associated with high cost.

Lumenis® LightSheer® Hair Reduction solution

Lumenis® LightSheer® family of permanent hair reduction products offers unparalleled treatment speed and efficacy with optimal patient comfort.

LightSheer® is more than 75% faster than the average hair reduction session, and also features the unique HIT™ and ChillTip™ technologies for pain relief. Additionally, LightSheer® is a smart economical choice, saving you money spent on temporary hair removal solutions.

Ask your Physician today about LightSheer® and how it can help you reach the results you desire.

How does it work?

LightSheer® laser system

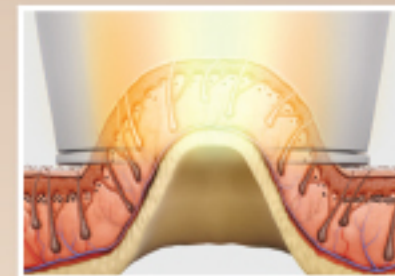

The LightSheer® uses a state-of-the-art 805nm diode laser, which ensures safety for all skin types. Repeated laser pulses target existing hair, creating a direction of energy into the hair follicles that prevent future growth. The LightSheer® allows your physician to truly customize treatment for your hair type, skin type and lifestyle by utilizing 2 different handpieces and technologies.

HIT™ technology

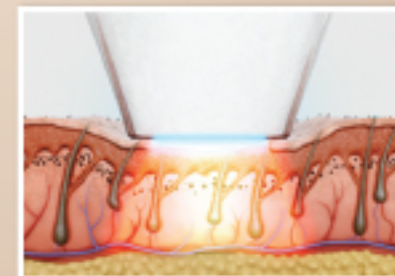

The High-Speed Integrated Technology (HIT™) incorporates suction to elevate and stretch the skin. In doing so, the laser achieves maximum absorption into hair follicles and fast coverage of large areas, which minimize the sensation of heat.

ChillTip™ technology

The ChillTip™ technology uses a proprietary cooling system to momentarily numb the skin to minimize pain, while compressing the handpiece to the skin to rotate the follicle and enable better results.

With HIT™, the vacuum gently draws skin into the handpiece, stretching it thin and pulling the target closer to the energy source.

With ChillTip™, the skin is cooled before and during treatment. It is then compressed and the laser beam is directed to the skin.
